Solid Earth deformation and gravity changes due to surface loading: The new IERS/GGFC Special Bureau for Loading (SBL)

Presented by
Hans-Peter Plag
Norwegian Mapping Authority, Hønefoss, Norway
for
The SBL Team

- Introduction
  - The Way to the SBL
  - Objectives
  - Membership
- Scientific Agenda
- Work, Tasks and Products of the SBL
- Outlook
Call for Proposals October 31, 2001:

Objectives

... IERS conventions currently do not give comprehensive recommendations for treating the loading signals due to the full range of possible effects. ...

... timely to set up the tools that provide a basis for a future conventional treatment of loading effects in all IERS analyses ...

future requirements calls for considerable theoretical work, algorithm developments, model compilations and studies of relevant observations ...

SBL service operations ... computing and releasing the loading deformation and relevant geodynamic products, ...

... both vertical and horizontal components on both land surface and ocean bottom, with as high temporal- and spatial-resolution as feasible, and released in a fashion of as near-real time as feasible. ...

... atmosphere, oceans, land hydrology, cryosphere, and tides.
## Current Membership

Two separate agendas:

**operational:** provide in near real-time a consistent global solution data set describing at least the surface deformation, gravity signal and geo-centre variations due to the various surface loading process in reference frames relevant for direct comparison with existing geodetic observing techniques.

**scientific:** major scientific advances with respect to the Earth model, the theory and algorithms used to model deformations of the Earth and the observational data of surface loading.
Loading Predictions

Earth Model
- geometry
- mechanical properties
- rheology

Model surface load
- boundary conditions
- extension of load

Surface load data
- atmosphere
- ocean
- land
- hydrosphere
- cryosphere

Theory
- continuums mechanics
- boundary value problem

Numerical tools
- Love Numbers
- Green’s Functions

Predictions:
- surface displacements
- gravity variations
- geocenter variations
- ...

Validation:
- intercomparison of software
- comparison to observations

Research products:
- time series (e.g. ITRF sites)
- grids

Operational products:
- conventional
- NRT
Spherically symmetric, non rotating, elastic, isotropic: SNREI

- PREM or ?
- PREM: surface layer: 3 km ocean
- PREM: frequency-dependent shear modulus: elastic module?
- PREM: parameterisation of depth-dependency
Surface Loads

Relevant surface loads:

- atmospheric loading
- ocean loading (tidal and non-tidal)
- continental water storage

Eventually needed:

Global pressure field on the surface of the solid Earth:

\[ p = p(\lambda, \theta, t; h_s) \]

where \( h_s \) height of Earth’s surface.

Density variation above the surface of the solid Earth:

\[ \delta \rho = \delta \rho(\lambda, \theta, h, t) \]

Atmosphere:

- National Center for Environmental predictions, USA (NCEP): Analyses and forecasts for 5 days;
- Japan Meteorological Agency (JMA): Analyses and forecasts to 8 days;
- European Centre for Medium-Range Weather Forcasts (ECMWF): Analyses and forecasts to 10 days.
Surface Loads

Ocean (non-tidal):
- two models with regular update:
  - Mercator
  - ECCO
- Forcing: surface wind stress, heat and salinity fluxes

Problems:
- no air pressure forcing;
- spin-up very long;
- mass conservation.

Continental hydrology:
- models using meteorological observations as input:
  - Huang et al. (1996): monthly results 1979 - 1993;

Problem: large uncertainties.

General problems:
- reference surface
- trends
CE: Center of mass of the solid Earth
(Farrell, 1972)

CM: Center of Mass of the Earth System
(SLR)

CM: Center of Figure
(GPS)

Basic difference:
degree-one Load Love Numbers
WP1: Earth models

WP2: Green’s functions and convolution algorithms

WP3: Surface loads

WP4: Development of integrated models

WP5: Computation of loading signals

WP6: Validation and reanalyses

Products:
— near-real time
— research datasets

WP7: Distribution
Mercator:
Phase 2: January 2002 - second MERCATOR prototype (PSY2). Marks the start of ”high-resolution” MERCATOR forecasting for European seas.
Real-time routine modeling of the North and Mediterranean at high resolution (1/15), assimilating altimetry and in-situ data and capable of performing analysis and prediction of three-dimensional ocean conditions in these regions.
Real-time routine acquisition of altimetry and in-situ data covering the global ocean, which are then merged to generate a three-dimensional picture.
High-resolution analysis and prediction (1/15) for North Atlantic and Mediterranean Analysis based on global ocean observations
Phase 3: January 2003 - third MERCATOR prototype (PSY3)
Marks the rollout of the MERCATOR system for GODAE.
Real-time routine modeling of the North and Mediterranean at high resolution (1/15), assimilating altimetry and in-situ data.
Real-time routine modeling of the Global Ocean at medium resolution (1/4°), assimilating altimetry and in-situ data and capable of performing analysis and prediction of global three-dimensional ocean conditions.
High-resolution analysis and prediction (1/15°) covering North Atlantic and Mediterranean Analysis and prediction of Global Ocean conditions at medium resolution
Overview Science Plan:

- **WP1 — Earth Models**
  - Decide on the requirements for the Earth model and compute Load Love Numbers.

- **WP2 — Green’s Functions**
  - Determine Green’s functions for Earth model of choice;
  - Optimize calculations of loading effects:
    * Compare convolution in space domain (”point loading”) with spherical harmonic approach for load functions including ocean effects; what order of harmonics is required? what happens at the coasts? do we need a hybrid approach?
    * Optimize as much as possible point loading computations.
    * Is mass variation with height in the atmosphere significant for gravity observations?
• WP3 — Surface Loads
  – atmospheric surface pressure;
  – ocean bottom pressure;
  – continental water storage;
  – ocean tidal loading;
  – attempt to evaluate the accuracy of available mass loading models.

• WP4 — Integrated Earth system models
  – to be considered in the future
